

Maintain your edge with SiteMaintenance

- Save money with efficient maintenance and design.

Overview

SiteMaintenance provides a powerful key to the operations needed when the site or plant is in production. SiteMaintenance is based on the same platform as SiteBase which will make sure that everybody has access to data and documents instantly.

The key to a successful maintenance is that data is accurate and consistent valid for all the personnel needing the information to perform their duties and improve plant uptime, safety and compliance.

In SiteMaintenance it's possible to keep track of events, work orders, supervisions and inspections.

The events are registered and stored in a logbook and is the base for the planning of work orders and supervisions.

The work orders are divided into four different issues; Simple, Normal, Extended

and Miscellaneous.

Supervisions can be scheduled or object oriented. Scheduled maintenance is automatic generated from the system and object oriented maintenance is controlled by the setup for each object.

Inspections are reported into the system and reset the scheduled or object oriented maintenance.

A new feature in SiteMaintenance is that it handles individuals. Each individual is marked with a serial number that can be verified and connected to any object or related to any article. In SiteMaintenance you can keep track of each individual including the technical data and the status. All changes are listed in a history list or in the logbook.

Key features

- ✓ Integrated maintenance with design
- ✓ Intuitive, streamlined interface for fast workflow
- ✓ Calculation of costs
- ✓ Autogeneration of requests and purchase orders
- ✓ Templates for events, work orders and supervisions
- ✓ Automatic templates for inspection and control, FLT
- ✓ Specific interface for operators, working staff and engineers
- ✓ Integrated with SiteBase 5.0
- ✓ Works with Microsoft Office, AutoCAD, CADian, Visio
- ✓ Supported on Win NT/2000/XP/Vista
